Supplementary Figure S2. COX immunohistochemistry in the unmyelinated ONH of DBA/2J mice. COX immunoreactivity was concentrated in the unmyelinated ONH of 3 month-old mice (A-C, asterisks, see three different examples). In contrast, much less COX immunoreactivity was observed in the unmyelinated ONH of 10 month-old glaucomatous mice (D-F, asterisks, see three different examples). The sections were counterstained with the nucleic acid stain Hoechst 33342 (Blue color). Scale bar = 50 µm (A-F).
