Figure S4  **A summary of the morphological development of cone photoreceptor precursors in the pars plana and retina.** Illustrations of cone photoreceptor precursors in various stages of development are presented in a chronologic order (from left to right). The approximate date for the appearance of each type of cone photoreceptor precursors in the retina \(^{20}\) (upper row) and pars plana (lower row) is presented below the corresponding illustration although significant overlap was observed. Note that morphologically mature cone photoreceptor precursors were not identified in the pars plana. (E: embryonic day)
