Supplementary Figure S2.

Immonoconfocal microscopy for keratin 13 (green) expressed by normal oral mucosa (A), cultivated oral mucosal epithelial cells (OMECs) (D), and corneal tissues from Patients 1 (B), 2 (E), 3 (C), and 4 (F). Cell nuclei were counter-stained with PI (red). K13 staining was unanimously suprabasal, regardless in the oral mucosa (A), cultivated OMECs (D), or in all the corneal specimens (B, E, C, and F).
