Supplementary Figure 2. Immunohistochemical staining of rat outer retina, peripheral to the impact site, after ballistic injury (DAPI-stained nuclei shown in blue, 50μm scale bar). A-F. No caspase-8 staining (green) in injured (A-C) or intact control (D-F) retina at 5 hours after injury. Inner segments (IS) stained red with anti-complex IV antibody (C&F), localised between the outer nuclear layer (ONL) and the autofluorescent outer segments (OS; B&E) at 5 hours after injury. G-L. No caspase-8 staining in injured (G-I) or intact (J-L) retina at 48 hours after injury.
