**Figure s1. Multiplex protein suspension array of additional cytokines.** Cytokines were measured by multiplex protein suspension array as described. These cytokines were only detected at low levels and did not show significant induction by LPS stimulation. In fact, IL-10 and IL-17 levels were reduced at 24 h post-LPS challenge but were not significantly different between genotypes. (n = 8, mean ± SEM, **p < 0.01, ANOVA with Newman-Keuls post hoc test).
