SUPPLEMENTAL FIGURE 1. Signed test-retest sensitivity differences (second test minus first test) in all ABCA4-RD and RP subjects at all available retinal locations plotted as a function of local slope, age, fixation stability and locus of fixation. For visibility, data from foveally fixating ABCA4-RD patients and RP patients are plotted with small increments. 95% confidence interval of the overall coefficient of variation is shown with a pair of horizontal lines.
