Supplemental Figure 1: This is a summary of amplitude-velocity (main-sequence) relationship of visually guided horizontal and vertical saccades of viewing and non-viewing eyes. Each data point depicts individual saccade. Saccades from all subjects are collated in illustrated main-sequence. Blue data points depict saccades from V-pattern strabismus patients while red data points depict healthy subjects. Filled symbols are viewing eye, and open symbols are non-viewing eye. Eye velocity is plotted on the y-axis while corresponding value of saccade amplitude is on the x-axis. Blue and red data points overlap suggesting lack of difference between the amplitude to velocity relationship in strabismus and healthy subjects.
