Supplemental Fig 3. Expression of MMP1 and secretion of MMP3 proteins by cell line

Relative expression of MMP-1 protein after treatments (A) quantitated from the Western blot, and the secretion of MMP-3 protein to the culture media (B) analysed from ELISA: 24h incubation with 100 μU IFNγ, 500 μU IFNγ, 10ng TNFα, 50ng of TNFα, or 1h treatment with 300 μM or 600 μM H₂O₂ followed with 24h “chase” in RPEbasic medium. For densitometric evaluation of the Western blot, β-actin was used as a loading control and calibrator. Data are expressed as mean±SD. *p<0.05,
